<u>ABSTRACT</u>

A dynamic topic partitioning messaging system. The messaging system can include a message server; one or more topics stored in the message server; one or more subtopics associated with at least one of the topics in the message server; and, a dynamic topic partitioning system configured to partition the topics into the subtopics. Notably, the message server can be Java message service (JMS) compliant. In that regard, the message server can reside in a single process address space. For example, the process address space can be a Java virtual machine (JVM).
